

The Environmental Impact of Food Waste

According to the EPA, over one-third of the food produced in the United States is never eaten.

Food waste is the single most common material found in landfills and is responsible for around 6% of total global greenhouse gas emissions according to a study from Poore and Nemecek (2018.)

Atlas Organics was created as a way for every individual to have an avenue to personal impact on our planet through compost education and resources! We truly believe there is a hero in each of us that is ready to make a difference.
